## Introduction

We introduce GR00T N1.5, an upgraded version of the GR00T N1 foundation model for humanoid robots. With several architecture, data and modeling improvements, we find that N1.5 outperforms N1 on both simulated manipulation benchmarks and on the real GR-1 robot, detailed below. We expect users of N1.5 should observe better performance compared to N1, in particular improved generalization and better language following ability.

## Model and Data Updates

### Architecture

As with N1, GR00T N1.5 uses an [NVIDIA Eagle VLM](#) to encode text and visual observations. The vision-language embeddings from the VLM are then cross-attended to by the DiT which processes the state and noised actions.

## Improved VLM Grounding Capabilities

We have updated the VLM of GR00T N1.5, starting from Eagle 2.5 and tuned for better grounding capabilities and physical understanding. On RefCOCOg and our internal GEAR GR-1 grounding dataset with referring expressions, we observe that the N1.5 VLM model performs favorably compared to Qwen2.5-VL-3B - a comparable open-source model.

| Model          | Size | GR-1 grounding IoU (↑) | RefCOCOg-val IoU (↑) |
|----------------|------|------------------------|----------------------|
| Qwen2.5VL      | 3B   | 35.5                   | 85.2                 |
| GR00T N1.5 VLM | 2.1B | <b>40.4</b>            | <b>89.6</b>          |

## Training

We trained GR00T

we used AdamW with cosine learning rate schedule with warmup ratio 0.05. We used FLARE loss coefficient 0.2 for both pretraining and posttraining.

Our pretraining mixture included internal GR-1 data, OpenXE, simulated GR-1 (a.k.a. DexMG), neural trajectories from [DreamGen](#), and AgiBot-Beta:

## Experiment

### Architecture va

In order to tune the model architecture for N1.5, we trained policies from scratch on two sim robot benchmarks requiring language following: [Language Table](#) and a set of five simulated GR-1 tasks requiring language ("Sim GR-1 Language"). We find that the N1.5 architecture achieves significantly higher success rates on both benchmarks, indicating stronger language-conditioned control ability.

| Benchmark         | GR00T N1 (scratch) | GR00T N1.5 (scratch) |
|-------------------|--------------------|----------------------|
| Language table    | 52.8%              | <b>93.2%</b>         |
| Sim GR-1 Language | 36.4%              | <b>54.4%</b>         |

### Data-limited post-training in simulated environments

Following the GR00T N1 evaluation protocol, we evaluate N1.5's performance in data-limited post-training. In the case of Sim GR-1, we can evaluate both fewshot and 0-shot, since the the

pretraining mixture includes other Sim GR-1 tasks with the same embodiment. We find that N1.5 is significantly better in the very low data regime (0-shot and 30 demos).

| Simulation Benchmark | GR00T N1 | GR00T N1.5 |
|----------------------|----------|------------|
| RoboCasa, 30 Demos   | 45.5%    | 65.0%      |
| Sim GR-1, 0-shot     | 45.5%    | 65.0%      |
| SimGR-1, 30 Demos    | 45.5%    | 65.0%      |

### Real GR-1 language

We add a simple language interface to the real GR-1 robot. The robot is able to follow language commands and the robot is able to place objects on a table. The target fruit is sampled to be one of the target fruit.

| Setting                 | GR00T N1 | GR00T N1.5 |
|-------------------------|----------|------------|
| Language following rate | 45.5%    | 65.0%      |
| Overall success rate    | 45.5%    | 65.0%      |

We find that N1.5 significantly improves over N1 in terms of its ability to follow language commands on the real GR-1 robot. Although both policies consistently pick and place *some* fruit onto the plate, N1.5 has a much higher language following rate, leading to a higher overall success rate.

### Learning to manipulate novel objects from human ego videos

To evaluate the model's generalization ability, we evaluate pick and place performance using a set of 10 novel objects not seen during pretraining.

*Novel object generalization performance. We observe that N1.5 both performs better 0-shot, and also benefits from co-training with human videos.*

## Generalization to novel behaviors using Neural Trajectories

To generalize beyond the teleoperation data and enable humanoid robots to learn new tasks in new environments, we use [DreamGen](#) to generate synthetic robot data for training.

Loading video...

*DreamGen 4-step pipeline.*

Through the DreamGen pipeline, we show that GR00T N1.5 can achieve non-trivial results on 12 new verbs (see Table 1). We find that GR00T N1.5 achieves a success rate of 3.1% for GR00T N1. Although these results are low, we never collected teleoperation data for these verbs; leaving room for future work.

## Post-training on GR00T N1.5

We post-train GR00T N1.5 on the GR00T N1.5 dataset. As in the GR00T N1.5 pretraining, we use a single object and one discrete action. The model achieves much higher success rates than GR-1 pretraining on the GR00T N1.5 dataset, as seen in the results on unseen objects.

## Discussion

Success rate 44.0% 98.8% 84.2%

Overall, we see that GR00T-N1.5 is a significant improvement over GR00T-N1. It achieves higher success rate, can use more diverse data sources, and has significantly improved language following capabilities. We attribute these improvements to the improved grounding capabilities, usage of the FLARE loss and the diverse data from DreamGen. The model will be

open-sourced shortly, and we hope practitioners will observe improved results when finetuning GR00T-N1.5 on their own robots.
