Reproducible ML At Scale

Lavanya Shukla, Head of Growth

Agenda

- 1. Why do we need ML reproducibility?**
- 2. Model understanding through reproducibility**
- 3. Interactive model visualization**

Why do we need ML
reproducibility?

Training the **same model**,
with the **same hyperparameters**
... doesn't always lead to the **same results**

**Training the same model,
with the same hyperparameters
... doesn't always lead to the same results**

- Datasets – order of training examples
 - Differences in hardware, GPUs
 - Differences in ML library versions
 - Initialization of weights
 - Model architecture randomness – dropout
- 

The more our ML models impact the real world, the more we need them to be reproducible.

- Who gets a loan?
 - Who gets indicted?
 - How long is someone's sentence?
 - Who's resume is good enough to be given an interview?
 - Who is trustworthy? Responsible?
- 

ML in regulated industries – An example

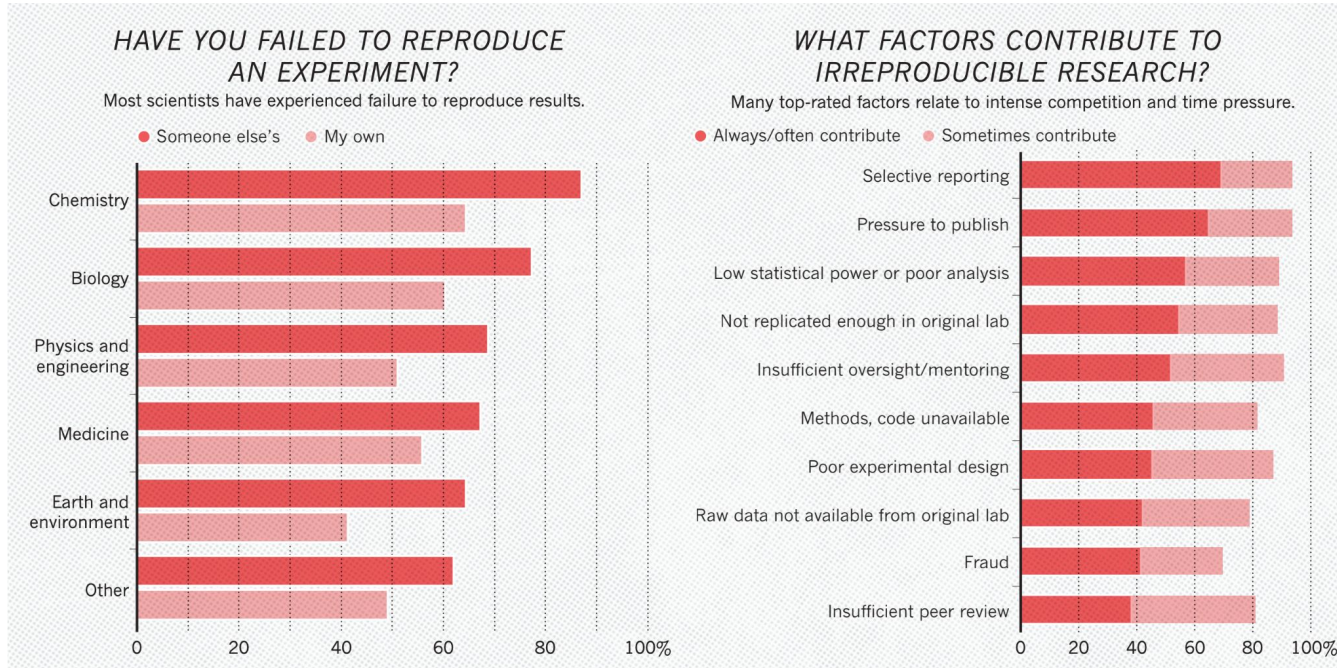

Reproducibility gap

- **Lack of access** to the same training data / **differences in data distribution**;
- Lack of availability of the code necessary to run the experiments, or **errors in the code**;
- **Under-specification of the metrics** used to report results;
- **Improper use of statistics to analyze results**, such as claiming significance without
- **Selective reporting of results** and ignoring the danger of adaptive overfitting;
- **Over-claiming of the results**, by drawing conclusions that go beyond the evidence

Is there a reproducibility crisis?

Have tried and failed to reproduce an experiment?

How many of you have tried and failed to reproduce an experiment?

**Do you have a process
for making your models reproducible?**

Do you have a process for making your models reproducible?

Is there a reproducibility crisis?

Source: [Nature](#)

**“REPRODUCIBILITY
IS LIKE BRUSHING
YOUR TEETH. ONCE
YOU LEARN IT, IT
BECOMES A HABIT.”**

What does it mean to be
reproducible?

For all **models** and **algorithms** presented, check if you include:

- ☐ A clear description of the mathematical setting, algorithm, and/or model.
- ☐ A clear explanation of any assumptions.
- ☐ An analysis of the complexity (time, space, sample size) of any algorithm.

For any **theoretical claim**, check if you include:

- ☐ A clear statement of the claim.
- ☐ A complete proof of the claim.

For all **datasets** used, check if you include:

- ☐ The relevant statistics, such as number of examples.
- ☐ The details of train / validation / test splits.
- ☐ An explanation of any data that were excluded, and all pre-processing step.
- ☐ A link to a downloadable version of the dataset or simulation environment.
- ☐ For new data collected, a complete description of the data collection process, such as instructions to annotators and methods for quality control.

For all shared **code** related to this work, check if you include:

- ☐ Specification of dependencies.
- ☐ Training code.
- ☐ Evaluation code.
- ☐ (Pre-)trained model(s).
- ☐ README file includes table of results accompanied by precise command to run to produce those results.

For all reported **experimental results**, check if you include:

- ☐ The range of hyper-parameters considered, method to select the best hyper-parameter configuration, and specification of all hyper-parameters used to generate results.
- ☐ The exact number of training and evaluation runs.
- ☐ A clear definition of the specific measure or statistics used to report results.
- ☐ A description of results with central tendency (e.g. mean) & variation (e.g. error bars).
- ☐ The average runtime for each result, or estimated energy cost.
- ☐ A description of the computing infrastructure used.

Model understanding through reproducibility

PROBLEM

Massive developer tools gap for ML

SOFTWARE 1.0 - WRITE CODE

Design	Version Code	Code & Collaborate	Deploy to Infra	CI/CD	Production Monitoring
 Figma  Sketch	 GitHub  GitLab	 Jira  VS Code	 HashiCorp  puppet	 circleci  Jenkins	 PagerDuty  DATADOG

SOFTWARE 2.0 - TRAIN MODELS

Prep & Visualize Data	Version Data & Models	Experiment Tracking	Manage Model Pipeline	Model CI/CD	Production monitoring
Custom apps Notebooks	Files in S3	Text files Screenshots	Text files	Custom scripts	Nothing

bit.ly/demo-run

Visualize gradients

See the inner workings of your model, look for convergence during training, and check for exploding gradients.

bit.ly/demo-run

System metrics

Get the most out of your GPUs
and identify opportunities for
optimizing hardware utilization.

bit.ly/demo-run

Capture the code

Save the most recent git commit, the command and args, and system hardware setup.

W&B also saves a patch file with uncommitted changes so you can reproduce the exact code that trained the model.

bit.ly/deep-drive-report

REPORTS

Collaborate easily

Give team members access to your exploratory results, sharing the context they need to quickly build on your work.

Weight decay: inconclusive

Initially increasing the weight decay 5X improved the accuracy by 9%. Increasing by 200X causes the same amount of improvement though.

Hyperparameter Sweep Insights

Sharing model insights with W&B

Scaling to 4 GPUs

Speed up: 4 GPUs: 2.5X, 2 GPUs: 1.6X

2.5X faster training on 4 GPUs vs 1 GPU

- model reaches a slightly higher validation accuracy 2.5X as fast when using 4 versus 1 GPU—this is the main advantage
- train/val acc/loss are not significantly affected by parallelizing the job across 1, 2, or 4 GPUs—this is expected and reassuring
- could continue tuning to improve relative speed-up—improvement is less than linear
- need better metrics (data throughput, batches per unit time, time to convergence) to quantify the added value of distributed training

Experiment

Train a 7-layer convnet on main iNaturalist dataset (5000 train / 800 val) as a proof of concept for the Keras `multi_gpu_model` function.

Notes

- initially no noticeable difference between 1 GPU and 2 GPUs—masked by one extremely slow run, batch 64_2, which stalled for 2 hours during training for unknown reasons. Leaving it out of the average shows that 2 GPUs yield a 1.6x acceleration
- accuracy vs batch size: consider effect of both batch size and number of GPUs
- for 2 GPUs, batch 64 > batch 32 / 128 > batch 256, but the effect is not super clear. 64 seems to be the optimal choice for batch size
- some combinations might be slower—resource sharing on the GPUs

Quickstart docs docs.wandb.com

Understand datasets
through interactive visualizations

Track artifacts

Get a bird's eye view of every step of model development.

Automatically checksum and version datasets and models.

Host your files anywhere with our infra-agnostic tracking.

<https://docs.wandb.com/artifacts>

Artifacts

- Integrated with the project
 - Get a clear understanding of what is consumed by and generated from runs and projects
- Can be consumed by any run with access to the project
 - Artifacts as a serving agent for downstream systems
- Automatically generates lineage graphs

Version datasets, models & any files

Organize, visualize, and share workflows

Interactive exploration & comparison

runs.summary["test_images_10K_E1"].table.rows

Row Table

[Single table →](#)

[Comparison →](#)

Tables Use Cases

- Log interactive media
- Manage data [splits](#) & iteratively refine datasets
- Visualize [predictions](#)
- Explore dynamically: filter, sort, group, add columns, & more
- Compare model [variants](#)
- Save Tables to workspace, report, etc.

Example: why are two models different?

Spot classes that confound the model

Spot images that confound the model

runs.summary["predictions_10K"] ⓘ Merge Tables: Table ⚙				runs.summary["predictions_10K"] ⓘ Merge Tables: Table ⚙
